Dontoxilysin (EC 3.4.24.69) B precursor - Clostridium botulinum

N;Alternate names: botulinum neurotoxin type B (BONT/B)

C;Species Clostridium botulinum

C;Date: 19-Dec-1993 #sequence revision 18-Nov-1994 #text change 09-Jul-2004

C;Accession: A48940; S48105; S21575; A42871; S07155; S08562; S07128; S08573; S08574

RT "Cleavage of members of the synaptobrevin, VAMP family by types D and F

Broulinal neurotoxins and tetanus toxin.",

L. FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter

CC and moves by retrograde transport up the axon into the spinal cord

where it can move between postsynaptic and presynaptic neurons. It

inhibits neurotransmitter release by acting as a zinc

endopeptidase that catalyzes the hydrolysis of the 58-Gln-|-Lys-59

condopeptidase that catalyzes the hydrolysis of the 58-Gln-|-Lys-59

condopeptidase that catalyzes the hydrolysis of proteins of the

neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No

detected action on small molecule substrates.

partial sequence and comparison.";
FASEB J. 2.41750-41750(1988).
-!- FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter
release. It binds to peripheral neuronal synapses, is internalized
and moves by retrograde transport up the axon into the spinal cord
where it can move between postsynaptic and presynaptic neurons. It
inhibits neurotransmitter release by acting as a zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  endopeptidase.

ANALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

CORACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodomer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.

J. Chease It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that catalyzes the hydrolysis of the 180-Arg-|-11e-

J. Manaparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

J. SUBNIT: Disulfide-linked heterodimer of a light chain (H). The light chain has the pharmacological activity, formation and toxin binding, respectively.

J. SUBCLIULAR LOCATION: Secreted.

J. MINCELLULAR LOCATION: Secreted.

J. MINCELLULAR LOCATION: Secreted.

J. MINCELLULAR LOCATION: Types A, B, C1, D, E, P, and G.

J. SIMILARITY: Belongs to the peptidase M27 family.

-i- FUNCTION: Inhibite acceptancy operipheral neuronal presynaptic
membrane, is then internalized by receptor-mediated endocytosis.
The C-terminus of the heavy chain (H) is responsible for the
adherence of the toxin to the cell surface while the N-terminus
mediates transport of the light chain from the endocytic vesicle
to the cytosol. After translocation, the light chain (L)
hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
neurotransmitter release. Inhibition of acetylcholine release
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -i- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for the treatment of strabismus and blepharospasm associated with dystonia and cervical dystonia. Also used for the treatment of hemifacial spasm and a number of other neurological disorders characterized by abnormal muscle contraction.

-i- MSCELLANGROUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.

-i- SIMILARITY: Belongs to the peptidase M27 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln. |-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. Botulinum toxin; neurotoxin; BoBT/F; immunogen; vaccine; botulism. Immunogenic type F botulinum toxin polypeptide (aa992-1135). Clostridium botulinum; type F strain Langeland AAW09016 standard; protein; 144 AA (first entry) (revised) 17-OCT-2003 31-MAR-1997 AAW09016; AAW09016

96WO-GB001409. WO9641881-A1 12-JUN-1996; 27-DEC-1996.

Elmore MJ, Mauchline ML, Minton NP, Pasechnik VA; (MICR-) MICROBIOLOGICAL RES AUTHORITY 

95GB-00011909.

12-JUN-1995;

Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant vaccine prodn. WPI; 1997-065467/06.

Claim 5; Page 18-19; 37pp; English.

Novel polypeptides (AAM09014-17) respectively comprise amino acids 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BONT/F). They lack the L chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine product Recombinant polypeptides can be produced in transformed host cells, as fusion proteins, e.g. with maltose binding protein to facilitate purification. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of a type F botulinum neurotoxin (BONT/F), and can be produced using a synthetic gene (AAT48101) based on the natural gene sequence (AAT48100) for the heavy chain. The polypeptides and its fragments (see also AAM09015-17) lack the light chain and HN epitopes necessary for metalloprotesse activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with malcose binding protein to facilitate purification. The invention relates to nover vaccines that induce a protective immune response against botulinum neurotosin (BoNT) serotypes A, B, C, D, E, and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (HC) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis vira (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and effects. The vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of serotypes are represented in the formulation. The novel vaccine of serotypes are represented in the formulation. The novel vaccine of immune response. Sequences AAY77134-Y77139 represent synthetic BoNT HC fragments used in the present invention. The DNA encoding these sequences had been optimised for codon usage for expression in yeast. Note: This sequence is not given on pages 45-46
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Botulinum neurotoxin; heavy chain; BoNT; serotype F; C-terminal fragment; Venezuelan equine encephalitis virus replicon; VBE; botulism; vaccine; diagnosis; drug screening.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a dichain and as 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encocing the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G
                                                                                                                                                                                                                                                                                                          206 VGCNDTRYVGIRYFKVFDTELGKTEIETLYSDEPDFSILKDFWGNYLLYNKRYYLLNLLR 265

Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an

The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine

transformed cells to produce peptide antigens useful for eliciting an timmune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G
                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                   New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as

Hc) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fushing the binding domain of boculinum neurotoxin type F (BONT)F) with translocation domain of diphtheria neurotoxin. (Updated on
